HEALTHCARE
Senior Care

Today Senior Care facilities continue to struggle with a reduced workforce and limited budgets. The desire to "do more with less" leads providers to turn to technology to streamline workflows, improve operational efficiency and ultimately enhance patient care.

We've captured the workflows with corresponding types of hardware that are most commonly used in these settings:

Electronic Health Records (EHR) Management:

Workflow: Tracking patient health records, including medical history, treatment plans, medications, and progress notes.

Devices: Mobile touchscreen computers and handheld tablets allow clinicians to access and update EHRs at the point of care. Wall-mounted kiosks in common areas provide quick access for staff to review patient information.

Medication Administration:

Workflow: Dispensing and administering medications, including dosage tracking and patient medication history.

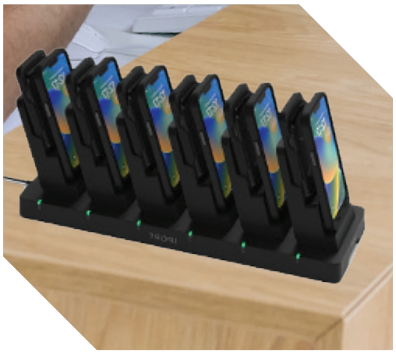
Devices: Handheld tablets equipped with barcode scanners streamline medication administration at the bedside. Automated dispensing cabinets and medication carts with integrated computers ensure accurate dispensing and documentation.

Telehealth and Remote Monitoring:

Workflow: Conducting virtual visits with patients, remote monitoring of vital signs, and managing chronic conditions.

Devices: Mobile touchscreen computers facilitate virtual visits between patients and healthcare providers alike.

Pioneer



Care Coordination and Communication:

Workflow: Facilitating communication among interdisciplinary care teams, including nurses, physicians, therapists, and social workers.

Devices: Secure messaging applications accessible via handheld phones or tablets or mobile touchscreen computers enable real-time communication between care team members. Use a multidock charging system and you'll never have to deal with cords and cables again.

Patient/Resident Engagement and Education:

Workflow: Providing patients and their families with educational materials, treatment plans, and discharge instructions.

Devices: Interactive patient engagement platforms deployed on bedside tablets offer multimedia educational content and interactive tools for patients to manage their care. Wall-mounted kiosks in common areas provide access to educational resources for patients and visitors.

Quality Assurance and Compliance:

Workflow: Monitoring and ensuring compliance with regulatory requirements and quality standards.

Devices: Desktop computers with specialized software for quality assurance and compliance management facilitate documentation, reporting, and audits. Handheld tablets or iPads equipped with checklist apps enable staff to conduct rounds and inspections efficiently.

By employing a variety of hardware solutions tailored to specific workflows, Senior Care facilities can optimize patient care delivery, enhance staff productivity, and improve overall operational effectiveness.

Contact Pioneer today to learn how you can achieve predictably successful outcomes through the use of technology.
